EXPERIENCE

Netflix

January 2024 — Present

Software Engineer → Senior Software Engineer — Consumer Identity and Access

New York, NY

- Enhanced security for subscriber data in “Copy prod to test” service by isolating environments and implementing key rotation, eliminating significant security vulnerabilities.
- Streamlined device retirement process through new UI development, reducing engineering hours and incorrectly retired devices while improving security and cost savings.
- Eliminated long-standing duplicate account bug in subscriber database by engineering a periodic, automated reconciliation process, preventing double charges for roughly 900 subscribers.
- Replaced legacy UI with new React-based interface, improving UX with modern integration patterns and efficient data-fetching.
- Provided architectural mentorship across the stack, focusing on functional patterns in React, scalable component design, and backend integration best practices.
- Authored alerting guidelines and co-created operational proposals, implementing PR templates and standardizing code quality practices.

Amazon

June 2019 — December 2023

Software Development Engineer II — Privacy

Austin, TX

- Built and maintained a suite of Java microservices on Amazon Coral, enabling secure, scalable handling of internal privacy data used by audit infrastructure.
- Key contributor to an internal privacy audit system (Python, Lambda, S3, CloudFormation) that cataloged 25K+ services and served 51K+ internal users.
- Reduced request latency by 66% by migrating core backend from Python + Lambda to Go on AWS Fargate.
- Built bulk import/export system (Go, React, Postgres, AWS) used by 8.5K+ engineers, saving hours by bypassing slow and manual web UIs.
- Created reusable patterns across the team’s full stack (Go, React, Node.js, AWS CDK, Postgres), significantly accelerating development velocity.
- Created reusable integration and unit test patterns for Java and React, enabling 90%+ unit test coverage across the backend and improving test efficiency.
- Built a microservice to replace a critical system, migrating 1M+ Postgres rows to DynamoDB with zero downtime and no data loss.
- Led 70+ technical interviews to hire top-tier engineering talent.

General Motors

June 2017 — June 2019

Software Developer — Manufacturing

Austin, TX

- Designed and implemented file validation system for internal audit tool using Java, Spring Boot, and Angular 2.
- Added JWT-based authentication and authorization to Spring Boot service with internal identity service integration.
- Created reusable S3 client in Java, reducing undifferentiated team effort.
- Introduced Redis caching layer to Spring Boot service, reducing homepage load times by 80%.
- Designed proof-of-concept clustered message filtering system with C#, Akka.Net, and Akka.Net Cluster for plant floor robot issue routing.
- Integrated SonarQube code scanners into the development pipeline, improving code quality.
- Increased legacy Java service unit test coverage to 80%+ with meaningful tests.
- Migrated legacy website from Spring and JSP to Spring Boot and Angular.

TECHNICAL SKILLS

AWS: Lambda, S3, Fargate, DynamoDB, RDS, SNS, SQS, IAM, EventBridge, CDK, Cloudformation

Languages: Go, Java, Python, Typescript, Smithy

Frameworks/Libraries: React, Angular, JUnit, Spring Boot

Developer Tools: Git, IntelliJ, VSCode, Postman

Databases: Postgres, DynamoDB

EDUCATION

University of North Texas

Bachelor of Science in Computer Science

Denton, TX

May 2017
